Ecommerce Application

COMPSCIX446

Christina Valen

2026-Oct-26

Overview

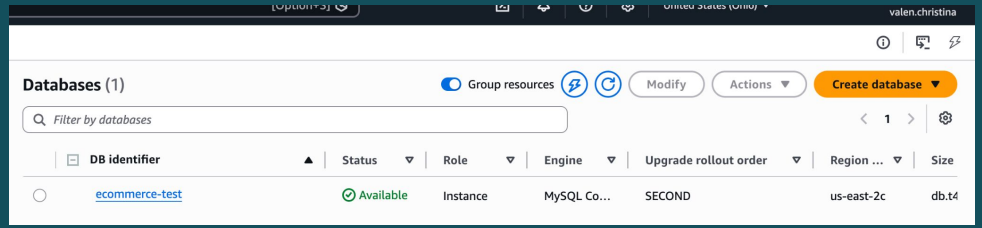

- A simple modern web application utilizing flask, python, and AWS relational database service.
- Built to replicate a shopping site with basic role based access, stock updating, and cart/order handling.
- Ideal customer would be someone looking for minimal interfaces and that does not plan on receiving items in return for submitting an order.

Features

- Authorizations: Certain actions require log-in or administrative access.
- Product handling: Stock, price, and description can be edited if accessed by an admin. Products are decremented when an order is submitted. Actions are taken to prevent adding an out-of-stock item to cart and including items in cart that are not available.
- Cart:
- Order:

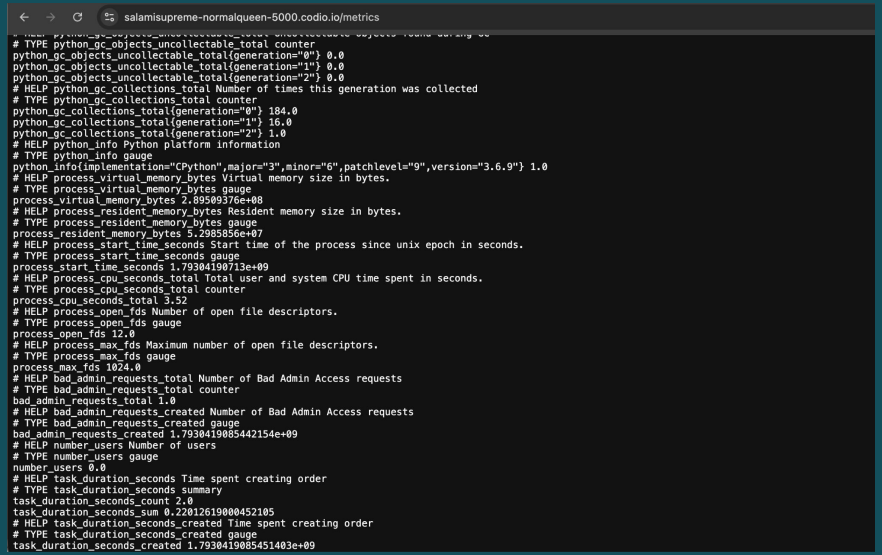

Integrations

- AWS relational database used.
- EC2 bucket for images.

- Prometheus logging available on

  Port 5000/metrics

Drawbacks

- SQL databases were developed on an as-needed basis. Little forethought was put into structure resulting in redundancies and inefficiencies.
- Unsuccessful logins will not indicate if the problem entry is the email or password. There is no way to retrieve a forgotten password or reset a password.
- The carts database is horribly inefficient and would likely bloat and cause memory issues in any actual use-case.
- Most obviously, as this is intended to be a toy application, there is no payment handling and address information is not requested at any point from the user.
